AUTHOR: Gorin, V. A. SCV/20-122-4-40/57  
TITLE: Genetic Zones of Oil and Gas Accumulation in the  
South Caspian Depression and the Origin of Oil and Gas  
(Geneticheskiye zony neftegazonosnosti Yuzhnoy Kaspiyskoy  
vpadiny i proiskhozhdeniye nefti i gaza)  
PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 122, Nr 4, pp 683-684  
(USSR)  
ABSTRACT: As a result of investigations concerning the occurrence of oil  
and gas in the South Caspian depression, a great deal of  
observational data has been assembled and thoroughly studied.  
This work makes possible a conclusion regarding the formation  
of oil and gas deposits, and leads us nearer to a solution of  
the problem of their origin. It has been accepted since 1938  
(Ref 2), that deep faults, originating from the tectonics and  
deformation of the west edge of the depression, have played  
the chief roll in controlling the occurrence of gas and oil.  
This has been substantiated by geophysical investigations,  
and, more importantly, by the position of the large, active  
mud volcanoes. The author has distinguished 2 basic directions  
of faults and associated volcanoes: northwest-southeast

Card 1/3

( )

Genetic Zones of Oil and Gas Accumulation in the South Caspian Depression and the Origin of Oil and Gas SOV/20-122-4-40/57

(kavkazskoye) and northeast-southwest (Ref 2). These are the chief dislocation planes of the lower Tertiary and Mesozoic masses in the tectonic scheme. Especially notable is the direct correspondence between the periods of intensive mud vulcanism and the fluctuations in the level of the Kaspiyskoye more (Caspian Sea) within the last 150 years (Refs 1 and 4). It may be firmly asserted that oil and gas accumulations of the depression have originated through vaporous migration from oil and gas producing foci near the base of the sedimentary complex. The position of the roots of the mud volcanoes allows these foci to be seen in the contact zone between the sedimentary mass and the crystalline basement. Migration was chiefly vertical, and lateral migration occurred later only in the reservoir beds, in which the oil and gas was distributed according to gravitational laws. The source beds are not known, since the source of the oil and gas lies at great depth. The author specifies 4 genetic zones of regional oil and gas containing layers: a. the northern Apsheronkiy anticline, b. the southern anticline, c. the Alyatskiy anticline, and d. the Prikurinskiy anticline in the vicinity of Kura. Anticlines a. and b. are (together with the related faults)

Card 2/3

Genetic Zones of Oil and Gas Accumulation in the SCV/20-122-4-40/57  
South Caspian Depression and the Origin of Oil and Gas

in the region of the richest oil deposits of the sea and mainland, which are currently being exploited on the Azerbaydzhanskaya structural step. Anticlines c. and d. are related to the southeast edge of this structural step. The Turkmenskaya tectonic step of the eastern edge of the depression plays an analogous roll. From these observations (chiefly in Azerbaydzhan) it is to be concluded that S. A. Kovalevskiy (Ref 5) and N. A. Kudryavtsev (Ref 6) are close to the solution of the question of oil and gas genesis, apart from the difference of opinions concerning the organic or inorganic origin of oil. There are 1 figure and 7 references, 7 of which are Soviet.

SOV/20-126-2-33/64

TITLE: Petroleum Volcanic Necks and Asphaltic Pebble in Pliocene Deposits of the Apsheron Peninsula (Nefte vulkanicheskiye nekki i asfal'tovaya gal'ka v otlozheniyakh plitsena Apsheronskogo poluostrova)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 2, pp 344-347 (USSR)

ABSTRACT: In the tectonic scheme of the western edge of the Yuzhno-Kaspiyskaya (South Caspian) depression, the Apsheron Peninsula takes the place of the northern Apsheron wall of the mesozoic structural stage (Ref 1). Ranges of now active and fossil mud- (mud-petroleum)-volcano and natural gas outlets (Fig 1) stretch along the north-west and south-east edge of this wall. Discovered by the author, these necks and dykes at the bottom of the productive mass are directly connected to the northern edge of the said wall, where very rich petroleum deposits are (Figs 2, 3). Moreover, the deposits of asphaltic pebbles (Ref 4) in the sediments of the Apsheron stage (Fig 4) are also connected to the said wall. The fossil petroleum-volcanic necks and dykes with their related now active mud-volcanoes

Card 1/4

Petroleum Volcanic Necks and Asphaltic Pebble in  
Pliocene Deposits of the Apsheron Peninsula

SOV/20-126-2-33/64

stretch, as a narrow strip along a break-gorge. Here, on the continuation of a strip of fossil mud-volcanoes, and in the vicinity (Ref 2), numerous necks and dykes are to be found at the bottom of the productive mass. The origin of these necks is connected to the long working effect of almost perpendicularly-rising streams of a very gaseous petroleum. These streams have polished the side-walls of the almost perpendicular canals. Isolated necks measure 2-3 meters across, but also sometimes form groups, and with an increasing diameter the unite to a single large neck. They are also formed of breccias, in which petroleum has replaced water. The said necks and dykes prove an earlier perpendicular migration of petroleum and natural gas into the productive mass of the Apsheron Peninsula, and the saturation of this mass with petroleum. They penetrated a considerable part of the now washed-out productive mass. Their roots are connected to petroleum and natural gas deposits of the lower structural stage. The component composition of the bitumen, out of the spiralis chalk, proved (on the authority of T. M. Digurova) to be analogous to that of the substage of the

Card 2/4

Petroleum Volcanic Necks and Asphaltic Pebble in  
Pliocene Deposits of the Apsheron Peninsula

SOV/20-126-2-33/64

Kirmakinskaya suite. Large lumps of such chalk are also erupted by the mud-volcanoes. All this is an important proof (Refs 2, 3) of the fact, that the petroleum and natural gas deposits in the productive mass, are formed by a perpendicular migration out of the sediments laying beneath. Thus a genetical connection between the petroleum-natural gas-(mud-)-volcanism, the deep-seated fractures and the perpendicular migration of hydrocarbon, and the formation of exceedingly rich petroleum and natural gas fields was proved. Also the southern zone of the northern Apsheron wall proves the above statement. Figure 4 shows samples of "petroleum" pebbles, taken by T. M. Gadiyeva. There are 4 figures and 4 Soviet references.

TITLE: The Productivity of Open-hearth Furnaces as a Function of the Values of the Parameters of the Bath (Proizvoditel'nost' martenovskikh pechey v zavisimosti ot velichiny parametrov vann)

PERIODICAL: V sb.: Fiz.-khim. osnovy proiz-va stali. Moscow, AN SSSR, 1957, pp 42-60. Diskus., pp 160-187

ABSTRACT: A study of the performance of open-hearth furnaces of diverse tonnages revealed that the total time to complete a heat,  $Z$ , is expressed by the straight-line equation  $Z = \Sigma + K H_{av}$ ; the first term,  $\Sigma$  (the summation of the amounts of time needed for preparatory servicing, charging, reduction, and tapping), is not a function of the tonnage ( $T$ ) of the furnace, but is determined solely by the quality of the work-planning and the degree of mechanization; the second term (the sum of the amounts of time needed for melting and the "boil") is proportional to the mean depth of the bath; moreover, the coefficient  $K$  is a function of thermal and mechanical factors. An analysis of existing units of specific productivity of open-hearth furnaces, i.e., in terms of the yield.

Card 1/2

137-1958-2-2426

The Productivity of Open-hearth Furnaces (cont.)

revealed their complicated dependence on the design and dimensions of the baths, which makes these units unsuitable for comparing the performances of open-hearth furnaces of equal tonnage. It was found that the hourly productivity of open-hearth furnaces is proportional to certain functions of their dimensions:

$$P \approx M \sqrt[3]{T^2} \quad \text{and} \quad P \approx L \sqrt[3]{H_{av}} \cdot S_0$$

wherein  $S_0$  is the area of the bath surface,  $P$  is the productivity of the open-hearth furnace, and the coefficients  $M$  and  $L$  (which are proportional to one another) are the absolute units of specific productivity and are independent of the dimensions of the furnaces. The yield of steel, taken in units of  $T^{2/3}$ , which is called the nominal working capacity of an open-hearth furnace, is determined solely by the quality of work planning and the degree of mechanization. These findings have been verified by data obtained from questionnaires covering 89 foreign and domestic furnaces of from 4 to 320 tons.

TITLE: A Rotary Spout for the Discharging of Metal From Large Open-hearth Furnaces (Povorotnyy zhelob dlya vypuska metalla iz bol'shegruznykh martenovskikh pechey)

PERIODICAL: Sb. nauchn. tr. Magnitogorskiy gorno-metallurg. in-t. 1957. Nr 11, pp 70-76

ABSTRACT: The Magnitogorsk metallurgic combine developed a rotary spout for large open-hearth furnaces, which ensures good control over the filling of two ladles with metal and slag when the melt is discharged. The spout is mounted on two supporting sections set on rollers and may be rotated by means of a power drive from an electric winch. The lining of the spout interlinks with a trough (approximately 400 mm long), attached to the mounting plate of the discharge opening of the furnace.

TITLE: Car-bottom Slag Pockets for Rapid Slag Removal Regardless of its State of Aggregation (Vydvizhnyye shlakoviki dlya bystrogo udaleniya shlaka pri lyubom agregatnom sostoyanii)

PERIODICAL: Sb. nauchn. tr. Magnitogorskiy gornometallurg. in-t. 1957, Nr 11, pp 77-84

ABSTRACT: The design of car-bottom slag pockets for open-hearth furnaces developed by the Magnitogorsk gornometallurg. in-t (Institute of Metallurgy and Mining) is described. The receiving element (RE) in the form of a lined metal box is mounted on a carriage, and is rolled out by a crane onto the pouring platform. The tops of the slag pockets rest on horizontal beams borne in turn by metal columns fixed into the foundation. Reinforcing wedges 50-80 mm high are provided between the carriage and the RE. After they are pulled out by a crane, the RE, which has fused to the roof of the slag pocket pulls away under the effect of its own weight. The RE is calculated to take 250-270 heats. The weight of a full RE is 200-250 t. The force to roll it clear

Card 1/2

137-58-4-6687

Car-bottom Slag Pockets (cont.)

from the roof is 3-5 t, and the time required for replacement during repairs when the furnace is shut down, is 3-4 hours. For future open-hearth furnaces, a sunken type of slag pocket is proposed, with the RE removed to the slag dump along inclined tunnels below the pouring platform. The benefits provided by car-bottom slag pockets are: elimination of the need to drill and fire charges to clean slag pockets, complete mechanization of slag removal, elimination of the partitions between gas and air slag pockets, and reduction in repair time and in open hearth furnace down time.

TITLE: A ground gravimeter, Class 42, No. 177106

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 24, 1965, 83

TOPIC TAGS: gravimetric analysis, measuring instrument, measurement accuracy  
gravimeter

ABSTRACT: This Author Certificate presents a ground gravimeter containing a quartz elastic sensitive system, units of distance control and control of the rotation angle of a micrometric screw, and an assembly of a photoelectric device with an illuminator. The design increases the precision of the measurements and makes possible the determination of the errors of the distance transmission. The unit of distance control in the gravimeter has precision multiple-turn linear potentiometers interconnected in a bridge circuit. One of the potentiometers is mounted in the gravimeter and the other on a control panel. The rotors of these potentiometers are connected with a tachometer. To reduce the temperature effects on the quartz sensitive system, the latter system is insulated from the photoelectric device.

Abstract : The pigs which consumed dry fodder from self-feeders, increased their weight during the 122 days of the experiment by 6.9 kg (10 percent) more, and expended 0.5 (10.7 percent) less feed units per 1 kg of weight gain than pigs which were fed the usual thickly mixed fodder. Finely ground fodder was consumed by the pigs more readily than coarsely ground fodder. -- A. D. Musin

AUTHOR: Gorin, V. Ye.

TITLE: Effect of gamma rays, fast neutrons, and ethylenimine on the induction of chromosome aberrations in winter wheat

Source: Vopr. Genet. i Evolyutsii, 1978, 14, 11-12

TOPIC TAGS: gamma ray, fast neutron dose, ethylenimine, mutation

ABSTRACT: Mutagenic agents--gamma rays, fast neutrons, and ethylenimine were found to differ in their capacity to induce chromosome aberrations in winter wheat (the air-dried seed of the VJR-46 and Ul'yanovka varieties). Gamma rays and fast neutrons were approximately 15 times more potent than ethylenimine in inducing chromosome aberrations. The induction of chromosome aberrations by ethylenimine was found to be dependent on the dose and the duration of treatment.

The induction of chromosome aberrations by ethylenimine was found to be dependent on the dose and the duration of treatment. The induction of chromosome aberrations by ethylenimine was found to be dependent on the dose and the duration of treatment.

SOV/42-13- 5-5/15

TITLE: On Norm Systems in a Countably Normed Space (O sn sistemakh norm v schetno-normirovannom prostranstve)

PERIODICAL: Uspekhi matematicheskikh nauk, 1958, Vol 13, Nr 5 pp 179-184 (USSR)

ABSTRACT: Let  $\Phi$  be a countably normed space [1,2], let  $\Phi_p$  be the complement

of  $\Phi$  with respect to the p-th norm. Let  $\Phi = \bigcap_{p=1}^{\infty} \Phi_p$ . Let  $\Phi^*$  be

the space conjugate to  $\Phi$ . Every linear continuous functional  $f \in \Phi^*$  has a finite order, i.e. for a certain p it holds  $f \in \Phi_p^*$ .

To every  $f \in \Phi^*$  there exists  $\|f\|_0 = \lim_{p \rightarrow \infty} \|f\|_p$ . The authors

investigate the question given by Shilov, G.E.: When this boundary value equals zero (or is unequal to zero)? It is asserted that this depends on the fact how the norm system in  $\Phi$  is chosen from the class of the equivalent norm systems which define the same topology in  $\Phi$ .

Theorem: In a complete space  $\Phi$  there exist systems of norms  $\{\|\varphi\|_p\}$  and  $\{\|\varphi\|_p'\}$  defining the initial topology and having the property that for every  $f \in \Phi^*$  it holds  $\|f\|_0 = \lim_{p \rightarrow \infty} \|f\|_p' = 0$ .

Card 1/2

On Norm Systems in a Countably Normed Space

SOV/42-13-5 5/15

and for every  $f \in \Phi^*$ ,  $f \neq 0$  it holds  $\|f\|_0' = \lim_{p \rightarrow \infty} \|f\|_p' > 0$ .

The proof of the theorem bases on seven lemmas.

AUTHOR: Gorin, Ye.A.

TITLE: On a Characteristic Property of the Ring of Continuous Functions <sup>10</sup>

PERIODICAL: Nauchnyye doklady vysshey shkoly. Fiziko-matematicheskiye nauki,  
1959, No. 2, pp. 19-21

TEXT: Theorem : Let R be a complete complex normed ring with the norm

$$\|x\| = \max_{t \in S} |x(t)|$$

which corresponds to the uniform convergence on the set S of the maximum ideals of R. If to every closed set  $F \subset S$ , to every  $x \in R$  and to a real  $\varepsilon > 0$  there exists an element  $x_\varepsilon \in R$ , such that it holds

$$(1) \quad \|x_\varepsilon\| < \max_{t \in F} |x(t)| + \varepsilon$$

$$(2) \quad x_\varepsilon(t) = x(t) \quad (t \in F)$$

then R is the complete ring of all continuous functions on S, i.e.  $R = C(S)$ .

P.S. Uryson is mentioned in the paper. The author thanks Professor G.Ye. Shilov for the guidance of the paper.

AUTHORS: Gorin, Ye. A., and Grushin, V. V.  
TITLE: Differential equations whose solutions are  
smoothed out on differentiation  
PERIODICAL: Moscow. Universitet. Vestnik. Seriya I.  
Matematika, Mekhanika, no. 2, 1963, 25-32

TEXT: The author considers a class of functions of many  
variables for which a partial derivative may be smoother than  
the function itself. Theorem 1. Let  $G$  be some finite region  
and  $q$  a non-negative integer.  $P(s) = P(s_1, \dots, s_n)$  is defined  
as a polynomial in  $n$  complex variables  $s_j = \sigma_j + i\tau_j$  ( $1 \leq j \leq n$ ),  
and  $N(P)$  is the manifold of all complex zeros of  $P(s)$ .  $P(D)$   
is defined as the operator

Card 1/3

Differential equations...

S/055/63/000/002/001/004  
D251/D308

$$P(D) = P\left(\frac{1}{1} \frac{\partial}{\partial x_1}, \dots, \frac{1}{1} \frac{\partial}{\partial x_n}\right).$$

If there exists  $k > 0$  such that for every  $q$ -times continuously differentiable solution in  $G$  of the equation

$$P(D)u(x) = 0 \quad (4)$$

the function  $\partial^k u / \partial x_1^k$  possesses continuous derivatives up to the  $(q + 1)$ th order, then for the manifold  $N(P)$ ,

$$|\tau| > a \mid \sigma \mid \gamma \mid s_1 \mid \gamma_1 - b \quad (5)$$

where  $a, b, \gamma, \gamma_1 > 0$ . The proof is based on some general considerations connected with Banach's theorem and on the

D251/D308

Seidenberg-Tarski theorem, (A. Seidenberg, Ann. Math. Ser. v. 60, 2, 1954, 365-374; Ye. Y. Gorin, UMN, no. 1, 1961, 91-118), and on the application of a Fourier transformation and Cauchy's theorem. Hence, Theorem 2: If on the manifold  $N(P)$  the inequality Eq. (5) is satisfied, then any solution of Eq. (4) will be smoothed on differentiation with respect to  $x_1$ .

Theorem 3. If the conditions of Theorem 2 hold, then for  $u(x)$  to be smoothed on differentiation with respect to  $x_1$  it is necessary and sufficient that  $\psi(x) = P(D)u(x)$  is smoothed on differentiation with respect to  $x_1$ . There is 1 figure.

[Abstracter's note: In the formula for  $s_j$ , ( $1 \leq j \leq n$ ) is incorrectly given as ( $1 \leq i \leq n$ ).]

FUNCTIONAL ANALYSIS (Funktional'nyy analiz), Part 1.   
Bibliography, index. Errata slip inserted.   
Notes: Spravochnaya matematicheskaya biblioteka.

TOPIC TAGS: functional analysis, mathematics, operator equations, mechanics, Hilbert space, Banach space, linear differential equation.

PURPOSE AND COVERAGE: This issue in a series of Handbooks of the Mathematical Library contains much material grouped basically around the theory of equations and operator equations. It presents the basic results and methods of functional analysis, theory of operators in Hilbert and Banach spaces, the theory of nonlinear operator equations, the theory of partial differential equations in partial derivatives, the theory of integral equations, the theory of generalized functions, the theory of distributions, and the theory of mathematical physics. There are also

The changes in the process of contact transformation of ethyl alcohol into butadiene, in connection with fatigue of the catalyst. Yu. A. Gulin, O. M. Nelmark and E. N. Kogan. *Soviet. Kautchuk* 1935, No. 6, 6-10. --Fatigue of the catalyst proceeded in 2 ways: (1) the C<sub>2</sub> formed by thermal decompn. of the org. mols., deposited on the catalyst in the form of a "carbon net," closing the dehydrating centers of the catalyst, and (2) regeneration of the catalyst, by means of burning of the catalyst with hot air (800°), changed the cryst. structure of the catalyst surface. These 2 phenomena resulted in an increase of H and decrease in ethylene in the gas products, an increase of unchanged EtOH, aldehydes, hydrocarbons and BuOH in the liquid products, and a lowered yield of butadiene. Tables and graphs are given. A. Pestoff

Catalytic conversion of alcohols into hydrocarbons of the divinyl series. II. Process of formation of divinyl from ethyl alcohol. Yu. A. Gapon. <i>Izv. Akad. Nauk SSSR Khim. Nauk</i> (U.S.S.R.) 10, 281 (1910); cf. C.I. 29, 4325. The catalytic transformation of mixts. of EtOH with AcH, aldol, and crotonaldehyde into divinyl over a Lebedev catalyst (C.I. 28, 3050) was studied between 380° and 451°. Best yields were obtained with 80:20 mixts. of EtOH:AcH at 425° or of EtOH:crotonaldehyde at 425° (both using Lebedev catalyst No. 11); the yields in these cases ranged from 22-45%. It was definitely shown that the admixts. enter the reaction and substantially improve the yield of divinyl. Low yields of divinyl were obtained by using the above admixts. with PtOH instead of EtOH; the best yields were obtained with an 80:20 mixt. of PtOH:crotonaldehyde (15.05% based on the aldehyde, using catalyst II at 425°). AcH, aldol, or crotonaldehyde in themselves do not yield divinyl in any significant amts. The following reaction scheme is proposed: EtOH → AcH → (aldol) → crotonaldehyde → divinyl. G. M. Kozlovskii

PROCESSING AND PROPERTIES INDEX

Catalytic transformations of alcohols into divinyl-type hydrocarbons. III. Condensation reactions of acetaldehyde in the process of divinyl manufacture according to S. V. Lebedev. Yu. A. Gorin. *J. Gen. Chem.* (U.S.S.R.) 16, 1099-1100 (1946) (in Russian); cf. *C.A.* 41, 685c. —Catalytic transformation of EtOH on the Lebedev dehydrogenation catalyst at 350° leads not only to dehydrogenation of the EtOH, but also to partial condensation of the resulting AcH. The behavior of AcH on the Lebedev catalyst between 200 and 450° shows that both condensation products (crotonaldehyde) and decomposition products are formed. The latter reaction increases with rise of temp. The dehydrogenating catalyst has a greater condensing action than the dehydrating catalyst.

Calcyltic conversion of alcohols into birring hydrocarbons. IV. Application of a new scheme to the formation of *Calcyl* hydrocarbons with a conjugate double bond from *Calcyl* hydrocarbons. Yu. A. Gerasimov, *J. Gen. Chem.* (U.S.S.R.), 17, 55-61 (1947) (in Russian); cf. C.A. 41, 3712.

Summary.—The reaction mechanism proposed previously, involving the fragments (a)  $\text{Me-CH}_2\text{CH=CH-}$  and (b)  $\text{Me-CH=CH-}$  (OII), did explain the formation of 2-methyl-1,3-pentadiene,  $\text{CH}_2=\text{C}(\text{Me})\text{CH=CH-CH}_3$ , by combination of (a) and (b) by the C atoms,  $\alpha$ - $\beta$ , but left unexplained the absence of products of combination through  $\alpha$  and  $\beta$  (4-methylpentadiene and 2,3-dimethyl-1,3-butadiene). According to the new scheme, the first stage of the catalysis,  $\text{Me-CH=CH-OH} \rightarrow \text{H}_2 + \text{Me-CH=CHO}$ , is followed, in accord with the rules of Lieben [Monatsh., 22, 289 (1901)] for added combination, by  $\text{Me-CH=CHO} + \text{CH}_3\text{Me-CHO} \rightarrow \text{Me-CH=CH-CH=CH-Me-CHO} \rightarrow \text{Me-CH=CH-CH=CH-CHO} + \text{H}_2\text{O}$ . In subsequent transformations, the C-MeCHO remains unchanged, only the bonds are rearranged in analogy with the  $\alpha$ - $\gamma$ -rearrangement of Bason and Farmer (C.A. 31, 7083):  $\text{Me-CH=CH-CH=CH-CHO} + 2\text{H} \rightarrow \text{Me-CH=CH-CH=CH-CHO} + \text{HO} + \text{Me-CH=CH-CH=CH-CHO}$ . The ethylene hydrocarbon  $\text{Me-CH=CH-CH=CH-CHO}$  is formed by dehydration of  $\text{Me-CH=CH-CH=CH-CH=CH-CHO}$  which can result from hydrogenation of either  $\text{Me-CH=CH-CH=CH-CHO} + 4\text{H}$  or  $\text{Me-CH=CH-CH=CH-CHO} + 2\text{H}$ . V. Catalytic formation of  $\text{C}_6\text{H}_6$  hydrocarbons from normal butyl alcohol. Yu. A. Gerasimov and F. A. Vasil'eva, *Izv. Vses. Khim. Nauchn. Ts. (Russian)*, (1) and (2) (1947) (3520 &), passed through a lab. furnace at a rate of 1 ml./min. in 30-ml. portions at 400° over a perfected, 40% catalyst which was renewed after each run, gave 710 l. gas, 402 g. water-wash products, and 302 g. unreacted oil. The mean compn. of the gas in vol. % was:  $\text{C}_2\text{H}_6$ , 37.3;  $\text{C}_3\text{H}_8$ , 40.2;  $\text{C}_4\text{H}_{10}$ , 1.6;  $\text{C}_5\text{H}_{12}$ , 1.6;  $\text{C}_6\text{H}_{14}$ , 0.5;  $\text{C}_7\text{H}_{16}$ , 0.4;  $\text{C}_8\text{H}_{18}$ , 0.3;  $\text{C}_9\text{H}_{20}$ , 0.2;  $\text{C}_{10}\text{H}_{22}$ , 0.1;  $\text{C}_{11}\text{H}_{24}$ , 0.1;  $\text{C}_{12}\text{H}_{26}$ , 0.1;  $\text{C}_{13}\text{H}_{28}$ , 0.1;  $\text{C}_{14}\text{H}_{30}$ , 0.1;  $\text{C}_{15}\text{H}_{32}$ , 0.1;  $\text{C}_{16}\text{H}_{34}$ , 0.1;  $\text{C}_{17}\text{H}_{36}$ , 0.1;  $\text{C}_{18}\text{H}_{38}$ , 0.1;  $\text{C}_{19}\text{H}_{40}$ , 0.1;  $\text{C}_{20}\text{H}_{42}$ , 0.1;  $\text{C}_{21}\text{H}_{44}$ , 0.1;  $\text{C}_{22}\text{H}_{46}$ , 0.1;  $\text{C}_{23}\text{H}_{48}$ , 0.1;  $\text{C}_{24}\text{H}_{50}$ , 0.1;  $\text{C}_{25}\text{H}_{52}$ , 0.1;  $\text{C}_{26}\text{H}_{54}$ , 0.1;  $\text{C}_{27}\text{H}_{56}$ , 0.1;  $\text{C}_{28}\text{H}_{58}$ , 0.1;  $\text{C}_{29}\text{H}_{60}$ , 0.1;  $\text{C}_{30}\text{H}_{62}$ , 0.1;  $\text{C}_{31}\text{H}_{64}$ , 0.1;  $\text{C}_{32}\text{H}_{66}$ , 0.1;  $\text{C}_{33}\text{H}_{68}$ , 0.1;  $\text{C}_{34}\text{H}_{70}$ , 0.1;  $\text{C}_{35}\text{H}_{72}$ , 0.1;  $\text{C}_{36}\text{H}_{74}$ , 0.1;  $\text{C}_{37}\text{H}_{76}$ , 0.1;  $\text{C}_{38}\text{H}_{78}$ , 0.1;  $\text{C}_{39}\text{H}_{80}$ , 0.1;  $\text{C}_{40}\text{H}_{82}$ , 0.1;  $\text{C}_{41}\text{H}_{84}$ , 0.1;  $\text{C}_{42}\text{H}_{86}$ , 0.1;  $\text{C}_{43}\text{H}_{88}$ , 0.1;  $\text{C}_{44}\text{H}_{90}$ , 0.1;  $\text{C}_{45}\text{H}_{92}$ , 0.1;  $\text{C}_{46}\text{H}_{94}$ , 0.1;  $\text{C}_{47}\text{H}_{96}$ , 0.1;  $\text{C}_{48}\text{H}_{98}$ , 0.1;  $\text{C}_{49}\text{H}_{100}$ , 0.1;  $\text{C}_{50}\text{H}_{102}$ , 0.1;  $\text{C}_{51}\text{H}_{104}$ , 0.1;  $\text{C}_{52}\text{H}_{106}$ , 0.1;  $\text{C}_{53}\text{H}_{108}$ , 0.1;  $\text{C}_{54}\text{H}_{110}$ , 0.1;  $\text{C}_{55}\text{H}_{112}$ , 0.1;  $\text{C}_{56}\text{H}_{114}$ , 0.1;  $\text{C}_{57}\text{H}_{116}$ , 0.1;  $\text{C}_{58}\text{H}_{118}$ , 0.1;  $\text{C}_{59}\text{H}_{120}$ , 0.1;  $\text{C}_{60}\text{H}_{122}$ , 0.1;  $\text{C}_{61}\text{H}_{124}$ , 0.1;  $\text{C}_{62}\text{H}_{126}$ , 0.1;  $\text{C}_{63}\text{H}_{128}$ , 0.1;  $\text{C}_{64}\text{H}_{130}$ , 0.1;  $\text{C}_{65}\text{H}_{132}$ , 0.1;  $\text{C}_{66}\text{H}_{134}$ , 0.1;  $\text{C}_{67}\text{H}_{136}$ , 0.1;  $\text{C}_{68}\text{H}_{138}$ , 0.1;  $\text{C}_{69}\text{H}_{140}$ , 0.1;  $\text{C}_{70}\text{H}_{142}$ , 0.1;  $\text{C}_{71}\text{H}_{144}$ , 0.1;  $\text{C}_{72}\text{H}_{146}$ , 0.1;  $\text{C}_{73}\text{H}_{148}$ , 0.1;  $\text{C}_{74}\text{H}_{150}$ , 0.1;  $\text{C}_{75}\text{H}_{152}$ , 0.1;  $\text{C}_{76}\text{H}_{154}$ , 0.1;  $\text{C}_{77}\text{H}_{156}$ , 0.1;  $\text{C}_{78}\text{H}_{158}$ , 0.1;  $\text{C}_{79}\text{H}_{160}$ , 0.1;  $\text{C}_{80}\text{H}_{162}$ , 0.1;  $\text{C}_{81}\text{H}_{164}$ , 0.1;  $\text{C}_{82}\text{H}_{166}$ , 0.1;  $\text{C}_{83}\text{H}_{168}$ , 0.1;  $\text{C}_{84}\text{H}_{170}$ , 0.1;  $\text{C}_{85}\text{H}_{172}$ , 0.1;  $\text{C}_{86}\text{H}_{174}$ , 0.1;  $\text{C}_{87}\text{H}_{176}$ , 0.1;  $\text{C}_{88}\text{H}_{178}$ , 0.1;  $\text{C}_{89}\text{H}_{180}$ , 0.1;  $\text{C}_{90}\text{H}_{182}$ , 0.1;  $\text{C}_{91}\text{H}_{184}$ , 0.1;  $\text{C}_{92}\text{H}_{186}$ , 0.1;  $\text{C}_{93}\text{H}_{188}$ , 0.1;  $\text{C}_{94}\text{H}_{190}$ , 0.1;  $\text{C}_{95}\text{H}_{192}$ , 0.1;  $\text{C}_{96}\text{H}_{194}$ , 0.1;  $\text{C}_{97}\text{H}_{196}$ , 0.1;  $\text{C}_{98}\text{H}_{198}$ , 0.1;  $\text{C}_{99}\text{H}_{200}$ , 0.1;  $\text{C}_{100}\text{H}_{202}$ , 0.1;  $\text{C}_{101}\text{H}_{204}$ , 0.1;  $\text{C}_{102}\text{H}_{206}$ , 0.1;  $\text{C}_{103}\text{H}_{208}$ , 0.1;  $\text{C}_{104}\text{H}_{210}$ , 0.1;  $\text{C}_{105}\text{H}_{212}$ , 0.1;  $\text{C}_{106}\text{H}_{214}$ , 0.1;  $\text{C}_{107}\text{H}_{216}$ , 0.1;  $\text{C}_{108}\text{H}_{218}$ , 0.1;  $\text{C}_{109}\text{H}_{220}$ , 0.1;  $\text{C}_{110}\text{H}_{222}$ , 0.1;  $\text{C}_{111}\text{H}_{224}$ , 0.1;  $\text{C}_{112}\text{H}_{226}$ , 0.1;  $\text{C}_{113}\text{H}_{228}$ , 0.1;  $\text{C}_{114}\text{H}_{230}$ , 0.1;  $\text{C}_{115}\text{H}_{232}$ , 0.1;  $\text{C}_{116}\text{H}_{234}$ , 0.1;  $\text{C}_{117}\text{H}_{236}$ , 0.1;  $\text{C}_{118}\text{H}_{238}$ , 0.1;  $\text{C}_{119}\text{H}_{240}$ , 0.1;  $\text{C}_{120}\text{H}_{242}$ , 0.1;  $\text{C}_{121}\text{H}_{244}$ , 0.1;  $\text{C}_{122}\text{H}_{246}$ , 0.1;  $\text{C}_{123}\text{H}_{248}$ , 0.1;  $\text{C}_{124}\text{H}_{250}$ , 0.1;  $\text{C}_{125}\text{H}_{252}$ , 0.1;  $\text{C}_{126}\text{H}_{254}$ , 0.1;  $\text{C}_{127}\text{H}_{256}$ , 0.1;  $\text{C}_{128}\text{H}_{258}$ , 0.1;  $\text{C}_{129}\text{H}_{260}$ , 0.1;  $\text{C}_{130}\text{H}_{262}$ , 0.1;  $\text{C}_{1$

max. amt. of dicarb. hydracarbon (80.95%); total amt. of 2-ethyl-2-butene (3.46%); total amt. of 2-methyl-2-pentene (3.14%); total amt. of the BuOH passed, 3.46% of the BuOH reacted; Oxidation with KMnO<sub>4</sub> gave AcOH, MeCOEt, and small amts. of HCOEt and EtCOEt. The C<sub>10</sub>H<sub>18</sub> fraction evidently represents a mixt. of several isomers: EtCOEt, CH<sub>3</sub>CH=CHMe, accounting for MeCOEt, and AcOH; MeCH=CMCH=CHEt, accounting for the AcOH and EtCOEt; EtC(CH<sub>3</sub>)=CHMe, giving on oxidation HCOEt, EtCOEt, and EtCOCH<sub>3</sub>; which is further oxidized into EtCOEt and CO<sub>2</sub>, the 3-methyl-2-pentene and 3-methyl-2-hexapentene are extremely present in larger amt., than the 2-ethyl-1,3-hexadiene. The fractions 5, 125–300° reacts with HBr to give C<sub>17</sub>H<sub>34</sub>, by 70–83°, and Cellulose, by 100–111°, close to by 109–111° of 3-methyl-2,4-hexadiene, dihydronaphthalene. (3) The 1st stage of the reaction consists in splitting 2H off the BuOH to give PrCHO: the latter undergoes condensation to give PrCH=C(Et)CHO: PrCHO + PrCH=C(Et)Pr → PrC(=IOH)CH=C(Et)Et → H<sub>2</sub>O + PrCH=C(Et)Et; this reaction was found to take place readily over the Lieberow catalyst at 224–419°. Reduction by the H supplied in the primary dehydrogenation of BuOH leads to an unreactive, alkyl, PrCH=C(Et)Et + 2H → PrCH=C(Et)H(Et), which, under the influence of the dehydrating component of the catalyst, loses H<sub>2</sub>O and isomerizes into either Pr=CHCH=CH<sub>2</sub> or Pr:CHCMe:C(Me)E or MeCH=C(Et)CH=CHMe, the latter two being more stable. VI. Catalytic formation of C<sub>8</sub>H<sub>16</sub> hydrocarbons from Isopropyl alcohol, Yu. A. Gortin, A. A. Vasil'ev, and A. K. Fandereva, /Ibid./, 617–22 (in Russian).—Under optimum conditions, 364–370°; rate of feeding of Me-C<sub>3</sub>H<sub>7</sub>OH 30 ml./min.; over a mixed Lieberow catalyst (vol. 5.1), a typical balance was: from 9162 g. Me-C<sub>3</sub>H<sub>7</sub>OH, 38 2285 l. (CO, 1.5; C<sub>2</sub>H<sub>4</sub>, 42.1; H<sub>2</sub>, 50.0 vol. %), condensate 6085 g. sepr. into an upper (hydrocarbon) layer, 1545 g., and a lower (alkyl) layer of the compo. MeCO, 27.7; ac. 17.4; and H<sub>2</sub>O 61.0 wt.-%; by distillation yield 10.0% of the Me-C<sub>3</sub>H<sub>7</sub>OH supplied, 17.5% of Me-C<sub>3</sub>H<sub>7</sub>OH reacted. Of the hydrocarbon layer, the fraction b, <130°, was further fractionated into b, <70°, 70–80°, 80–100°, 100–300° residue and losses, with the amts. 19.9, 55.3, 5.6, 13.5, 3.6, and 2.2 wt.-%, respectively. The main 70–80° fraction was narrowed down to 75–77° and separated as 2 methyl-1,3-pentadiene, with a small amt. of 2-methyl-2-pentadiene, detected by the hydrogen-absorpt. relative of the condensation product with male anhydride (B, and F, loc. cit.). The 75–77° fraction contains 94.5% C<sub>8</sub>H<sub>16</sub>, the rest is approx. 5% of the theory. The composition of the conversion is represented as follows: Me-C<sub>3</sub>H<sub>7</sub>OH, 14% → II, + MeCOEt, 2M-COME → MeCOCH=CH<sub>2</sub>+OH → H<sub>2</sub>O + MeCOCH=CH<sub>2</sub>: MeCO-CH=CH<sub>2</sub> + H<sub>2</sub> → MeCH(OH)CH=CH<sub>2</sub> → H<sub>2</sub>O + CH<sub>3</sub>-CH=CH-CMe or MeCH=CHCMe: ClI, VII. Catalytic formation of hydrocarbons C<sub>8</sub>H<sub>16</sub> from secondary butyl alcohol, Yu. A. Gortin and Ye. A. Borgman, /Ibid./, 1295–94 (in Russian).—With the Lieberow (ibid., 3, 608 /1933/) catalytic, modified in the sense of increased amt. of the dehydroforming component at the expense of the dehydrating part, averaged at 841°, 2 bar., EtC(CH<sub>3</sub>)=CH<sub>2</sub> gave the highest yield of liquid products at 300°. At that temp., rate of feeding 1 ml./min., total simple run 37.41 g., after repeated recycling of the unreacted acet. 37.61 g.; balanced gases, unreacted 1392 g. (gas 4611), hydrocarbons from condensate 357.5 g. The gas was, in vol. %, H<sub>2</sub> 8%, C<sub>2</sub>H<sub>4</sub> 11, the latter identified as 2-methyl-2-pentene (by bromination).

10

...the nature of the solvent follows the same pattern. (9) The enhancement of the relative wt. of the  $\sigma$  state in  $\pi$  is in keeping with the higher probability of the structure with the Kekulé double bond between the C atoms bound with Ac and OH, and conjugation between Ac and OH, as compared with the single bond structure and sep. conjugations. Ac- $\pi$  and OH- $\pi$  conjugation, corresponding to the  $\sigma$  state. Whereas in the case of II,  $\pi$  bonding can give rise only to internal waves, the shift in position of the bands of I are linked with internal waves, which is disrupted by methylation of OH. From the value of the short-wave shift, 415 Å (in C<sub>6</sub>H<sub>6</sub>) = 13,270 cal./mole, the energy of the  $\pi$  bond is found, correctly, to be 9285 cal./mole; in EtOH the corresponding value is 8990 (10). In an analogous way, the enhancement of the  $\sigma$  state and recession of the  $\pi$  state in II can be linked with the prevalence of 1 of the 2 possible conjugation structures; the effects of methylation and of alcohols (substitution with Na) are explained on the same basis. XIII. 2,4-Dihydroxyacetophenone and its methyl ethers. *Isol.* 783-807. The spectra of 2,4-(HO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>COMe (V), 2,4-(HO)MeO-C<sub>6</sub>H<sub>3</sub>COMe (VI), 2,4-MeO(HO)C<sub>6</sub>H<sub>3</sub>COMe (VII), and 2,4-(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>COMe (VIII) were investigated in view of the effect of simultaneous ortho and para substitution on the structure of PhCOMe. (1) In V in EtOH (4 X 10<sup>-3</sup> M) absorption begins at  $\lambda$  3720, the  $\epsilon_{\text{max}}$  is at  $\lambda$  3150,  $\epsilon$  7000; after a shallow min., the  $\epsilon_{\text{max}}$  lies at  $\lambda$  2785,  $\epsilon$  15,000; it is followed by a min.,  $\epsilon$  1800; narrow at  $\lambda$  2785,  $\epsilon$  15,000; it is followed by a min.,  $\epsilon$  1800; narrow at  $\lambda$  2785,  $\epsilon$  15,000. The  $\epsilon$  band is 1.4 times more intense than that of I,  $\epsilon$  1.7 times weaker than that of II; in EtOH (10<sup>-3</sup> M), absorption begins at  $\lambda$  3750;  $\epsilon_{\text{max}}$  at  $\lambda$  3160,  $\epsilon$  8900; min. at  $\lambda$  2835,  $\epsilon$  6000;  $\epsilon_{\text{max}}$  at  $\lambda$  2750,  $\epsilon$  16,000, followed by a band at  $\lambda$  2500-2600, a 2nd min. at  $\lambda$  1990, and a 3rd band  $\lambda$  2590,  $\epsilon$  10,000. The curve is a combination of those of I and IV;  $\sigma$  is shifted to shorter  $\lambda$  by 100 Å, and is 1.6 times more intense than in I;  $\pi$  coincides with the same band of IV;  $\sigma$  is of the same intensity as in I but is shifted to shorter  $\lambda$  by 227 Å. (2) The spectrum of VII in EtOH is almost identical with that of VI, except that  $\sigma$  ( $\lambda$  2785,  $\epsilon$  10,000) is slightly shifted to shorter  $\lambda$  and  $\pi$  ( $\lambda$  2785,  $\epsilon$  20,000) is longer  $\lambda$ . The spectrum results from a superposition of III and II;  $\sigma$  and  $\pi$  correspond to the same bands of III and II;  $\sigma$  and  $\pi$  intensity on 1.2 times;  $\pi$  remains in the same position as in II but is somewhat weaker. (4) Methylation of only the ortho OH in V makes  $\sigma$  from  $\lambda$  7000 to 10,000 and shifts it to shorter  $\lambda$  by 60 Å; makes  $\pi$  with a 25 Å shift in the opposite direction, and slightly raises  $\sigma$ . Methylation of the para OH in V raises  $\sigma$  only very slightly without marked shift in position but broadens the width of the max.; it somewhat broadens  $\pi$  coming to a 3-40 Å shift of its short-wave edge to shorter  $\lambda$ ; the max. is disrupted,  $\sigma$  is raised from  $\lambda$  6800 to 10,000 but is unshifted. (5) In VIII in C<sub>6</sub>H<sub>6</sub>,  $\lambda$  5 X 10<sup>-3</sup> M absorption begins at  $\lambda$  3530; a slight band occurs at  $\lambda$  2500-2600, 2 more extended ones at  $\lambda$  2580,  $\epsilon$  12,000; slight band at  $\lambda$  2590, 2nd min. at  $\lambda$  2320, 2 band  $\sigma$  on  $\lambda$  2275,  $\epsilon$  16,000, and a 2210,  $\epsilon$  1800. In EtOH,  $\sigma$  is somewhat raised and its long-wave edge makes the  $\lambda$  1990-2000 band.  $\pi$  is shifted to longer  $\lambda$  by 15 Å; the min. between  $\sigma$  and  $\pi$  is strongly blunted and raised to  $\lambda$  1990. Thus, substitution of both OH in

[illegible]
